Summary

IT Support & Security Engineer with 6+ years of experience supporting **business continuity, incident response, vulnerability management, SIEM/XDR monitoring, Linux support, and AWS operations**, with a strong focus on availability, resilience, and ISO 27001-aligned remediation

Work Experience

IT Support Engineer | Sirius Opensource Ltd | Reading, UK | June 2025 – Present

- **Engineered a Python-based triage workflow** between Wazuh (SIEM/XDR) and IRIS (DFIR/case management) to consolidate High, Critical, and Medium CVEs into actionable incidents, **cutting manual triage and improving security response time**
- **Implemented** daily, weekly, and monthly **vulnerability scheduling aligned to severity-based SLAs**, ensuring Critical issues were handled in 24–48 hours, High in 7–14 days, Medium in 30 days, and Low in 90 days following ISO 27001 guidelines
- **Built** IRIS cases as the system of record for incidents, vulnerabilities, assets, and evidence, **creating full audit traceability and supporting compliance with internal governance requirements**.
- **Developed** AWX/Ansible remediation playbooks to perform pre-patch AWS snapshots, surgical package updates, and Wazuh verification, **enabling safe remediation without taking servers offline**.
- **Implemented** a risk-acceptance workflow for unpatchable vulnerabilities by validating package status, cross-checking vendor CVE trackers, and documenting compensating controls, **supporting ISO 27001 Clause 6.1.3 and formal sign-off**
- Supported business continuity across production environments by executing weekly Ubuntu server patching and AMI lifecycle updates through controlled change management, maintaining system compliance

IT Analyst | Tata Consultancy Services Ltd | Reading, UK | May 2019 - May 2025

- **Analyzed** AWS security and compliance findings from Prowler/threat-score output, identifying misconfigurations such as missing IAM roles, enabling encryption to S3 buckets, AWS service compliance remediation
 - **Improved operational security** by integrating Wiki.js audit alerts with Slack through event-driven APIs, improving **change visibility across 6,000+ documents and reducing undocumented changes..**
 - **Resolved 500+ P1-P4 incidents** within SLA by performing log analysis, application triage, and ITIL-based incident handling, **consistently meeting MTTR targets**.
 - Delivered SLA, KPI, and capacity reporting to support resilience planning and reduce recurring service faults.
 - Improved cloud cost efficiency by managing Reserved EC2 renewals and reviewing CloudWatch logs, reducing underutilized infrastructure spend by 18%.
-

Projects: [GitHub](#)

1. Vulnerability Management Automation: Built a Python and AWX-driven vulnerability management workflow that triaged Wazuh alerts, created consolidated IRIS cases, applied surgical patching with pre-change AWS snapshots, and enforced ISO 27001-aligned remediation SLAs

2. WikiJs-Slack Notifier: Developed an event-driven notifier that streamed Wiki.js audit and change events to Slack, improving visibility of documentation updates, reducing undocumented changes, and supporting faster governance review

Education: Bachelor of Engineering in Electrical and Electronics Engineering | A N University, India | 2015 – 2019 | Grade: First Class with Distinction

Skills: **Wazuh:**SIEM/XDR and vulnerability detection, **IRIS-DFIR** and incident/case management, **Python:** triage logic, filtering, and alert consolidation, **AWX / Ansible:** remediation automation and playbook execution, **Prowler:** cloud security/compliance findings, **CheckMK & Splunk:**infrastructure monitoring, **AWS:** cloud telemetry, snapshots, IAM, EC2, Cloudwatch, Version control: **GIT**
